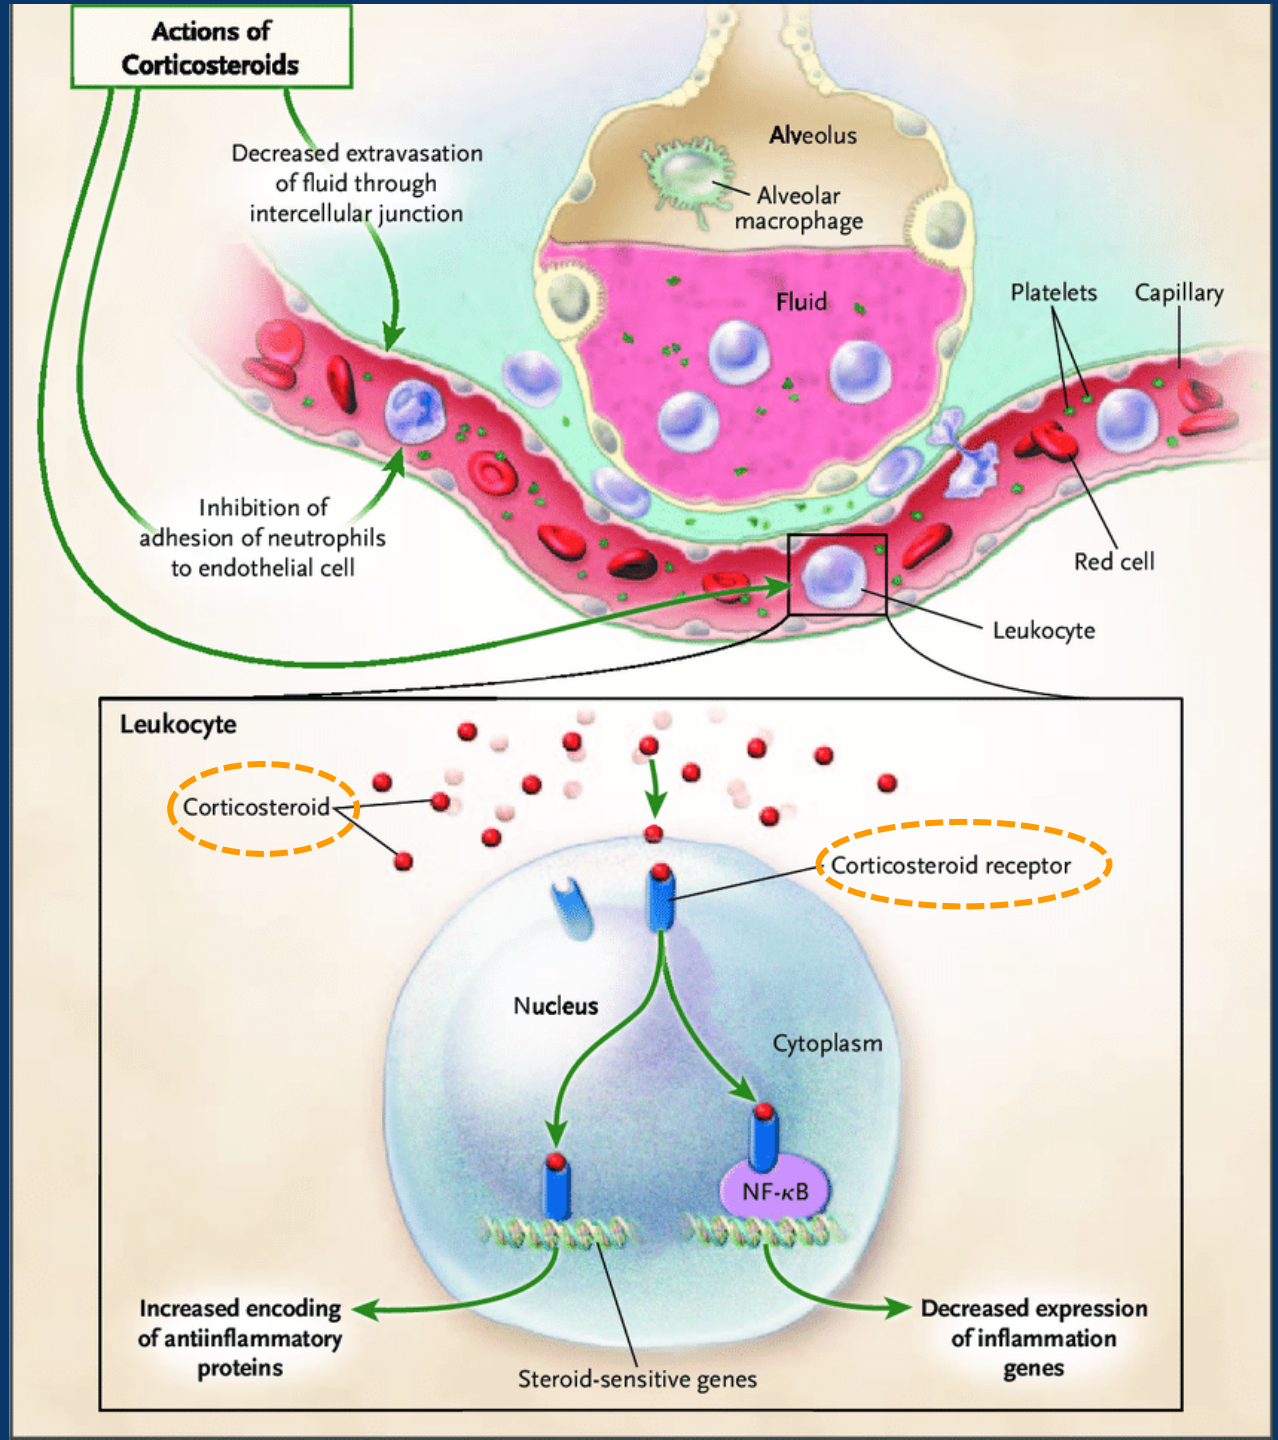
Lung inflammation in ARDS – Friend or foe?



Peter M. Suter
NEJM 2006, 354:1739-42

Corticosteroids can decrease the signs and symptoms of inflammation

- Reducing the extravasation of plasma through intercellular junctions of the capillary
- Inhibiting the adhesion and migration of leukocytes across the capillary wall
- Corticosteroids diffuse across leukocyte cell membranes and bind to glucocorticoid receptors in the cytoplasm.
- The activated corticosteroid–receptor complexes translocate into the nucleus, which may encode anti-inflammatory proteins
- Activated nuclear corticosteroid receptors also inhibit, or switch off, inflammation genes, thereby blocking the transcription of inflammatory proteins by nuclear factor-κB (NF-κB) and activator protein 1

Determinants of clinical efficacy of corticosteroids in ARDS

Timing of initiation: early better than late.

Dosage: sufficient to achieve close to maximal saturation of glucocorticoid receptor (MP 80-100 mg, DEXA 20 mg).

Mode of administration: iv bolus and/or continuous infusion.

Duration of exposure: no concerns about higher doses or prolonged (up to 28 days) treatment.

Dose tapering: gradual de-escalation to avoid inflammation rebound (when prolonged therapy).

Dexamethasone treatment for the acute respiratory distress syndrome: a multicenter, randomized controlled trial

JesúsVillarMD[acd]CarlosFerrandoMD[abe]DomingoMartínezMD[f]AlfonsoAmbrósMD[g]TomásMuñozMD[h]Juan ASolerMD[f]GerardoAguilarMD[e]FranciscoAlbaMD[i]ElenaGonzález-HigueraMD[j]Luís AConesaMD[f]CarmenMartín-RodríguezMD[g]Francisco JDíaz-DomínguezMD[k]PabloSerna-GrandeMD[h]RosanaRivasMD[l]JoséFerreresMD[m]JavierBeldaMD[e]LucíaCapillaMD[no]AlecTalletMD[p]…JesúsVillar

Summary

Background

There is no proven specific pharmacological treatment for patients with the acute respiratory distress syndrome (ARDS). The efficacy of corticosteroids in ARDS remains controversial.

Methods

We did a multicenter, randomized controlled trial in a network of 17 intensive care units (ICUs) in teaching hospitals across Spain in patients with established moderate-to-severe ARDS

Patients with brain death, terminal-stage disease, or receiving corticosteroids or immunosuppressive drugs were excluded.

Patients in the dexamethasone group received an intravenous dose of 20 mg once daily from day 1 to day 5, which was reduced to 10 mg once daily from day 6 to day 10

Dexamethasone treatment for the acute respiratory distress syndrome: a multicenter, randomized controlled trial

JesúsVillarMD[acd]CarlosFerrandoMD[abe]DomingoMartínezMD[f]AlfonsoAmbrósMD[g]TomásMuñozMD[h]Juan ASolerMD[f]GerardoAguilarMD[e]FranciscoAlbaMD[i]ElenaGonzález-HigueraMD[j]Luís AConesaMD[f]CarmenMartín-RodríguezMD[g]Francisco JDíaz-DomínguezMD[k]PabloSerna-GrandeMD[h]RosanaRivasMD[l]JoséFerreresMD[m]JavierBeldaMD[e]LucíaCapillaMD[no]AlecTalletMD[p]…JesúsVillar

Findings

Between March 28, 2013, and Dec 31, 2018, we enrolled 277 patients and randomly assigned 139 patients to the dexamethasone group and 138 to the control group.

At 60 days, 29 (21%) patients in the dexamethasone group and 50 (36%) patients in the control group had died (between-group difference −15·3% [–25·9 to −4·9]; p=0·0047).

The proportion of adverse events did not differ significantly between the dexamethasone group and control group.

The most common adverse events were hyperglycaemia in the ICU (105 [76%] patients in the dexamethasone group *vs* 97 [70%] patients in the control group), new infections in the ICU (eg, pneumonia or sepsis; 33 [24%] *vs* 35 [25%]), and barotrauma (14 [10%] *vs* 10 [7%]).

Interpretation

Early administration of dexamethasone could reduce duration of mechanical ventilation and overall mortality in patients with established moderate-to-severe ARDS

QUESTION Does treatment with systemic dexamethasone provide clinical benefit in adults with **established** moderate-to-severe acute respiratory distress syndrome (ARDS)?

CONCLUSION This randomized trial found that in patients with ARDS, intravenous dexamethasone administered for 10 days, compared with no-dexamethasone, resulted in significant reduction in ventilator-free days over 28 days and number of deaths over 60 days.

POPULATION

191 men
86 women

Adults with established moderate to severe ARDS ($PaO_2/FiO_2 \leq 200$ on a PEEP-FiO_2 trial at 24 h of meeting Berlin criteria.

Mean age: **57** years

LOCATIONS

17 ICUs
in 15 cities
of Spain

INTERVENTION

277 patients randomized

139 Dexamethasone

10 intravenous doses:
20 mg/day (day 1-5),
10 mg/day (day 6-10)

138 Control

No dexamethasone

Lung-protective ventilation in both groups

PRIMARY OUTCOME

Number of ventilator-free days at 28 days.

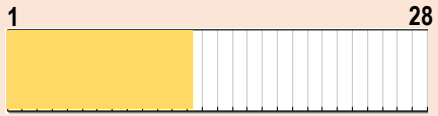
SECONDARY OUTCOME

All-cause mortality 60 days after randomization.

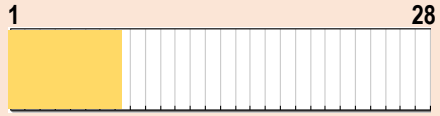
FINDINGS

Ventilator-free days (VFDs)

Dexamethasone
Mean VFDs
12.3 days



Control
Mean VFDs
7.5 days



Absolute difference: **4.8 days** (95% CI: 2.6 - 7.0)

All-cause mortality at day 60

Dexamethasone	**21%**	(29/139)
Control	**36%**	(50/138)

Absolute difference: **-15%** (95% CI: -26 to -5)

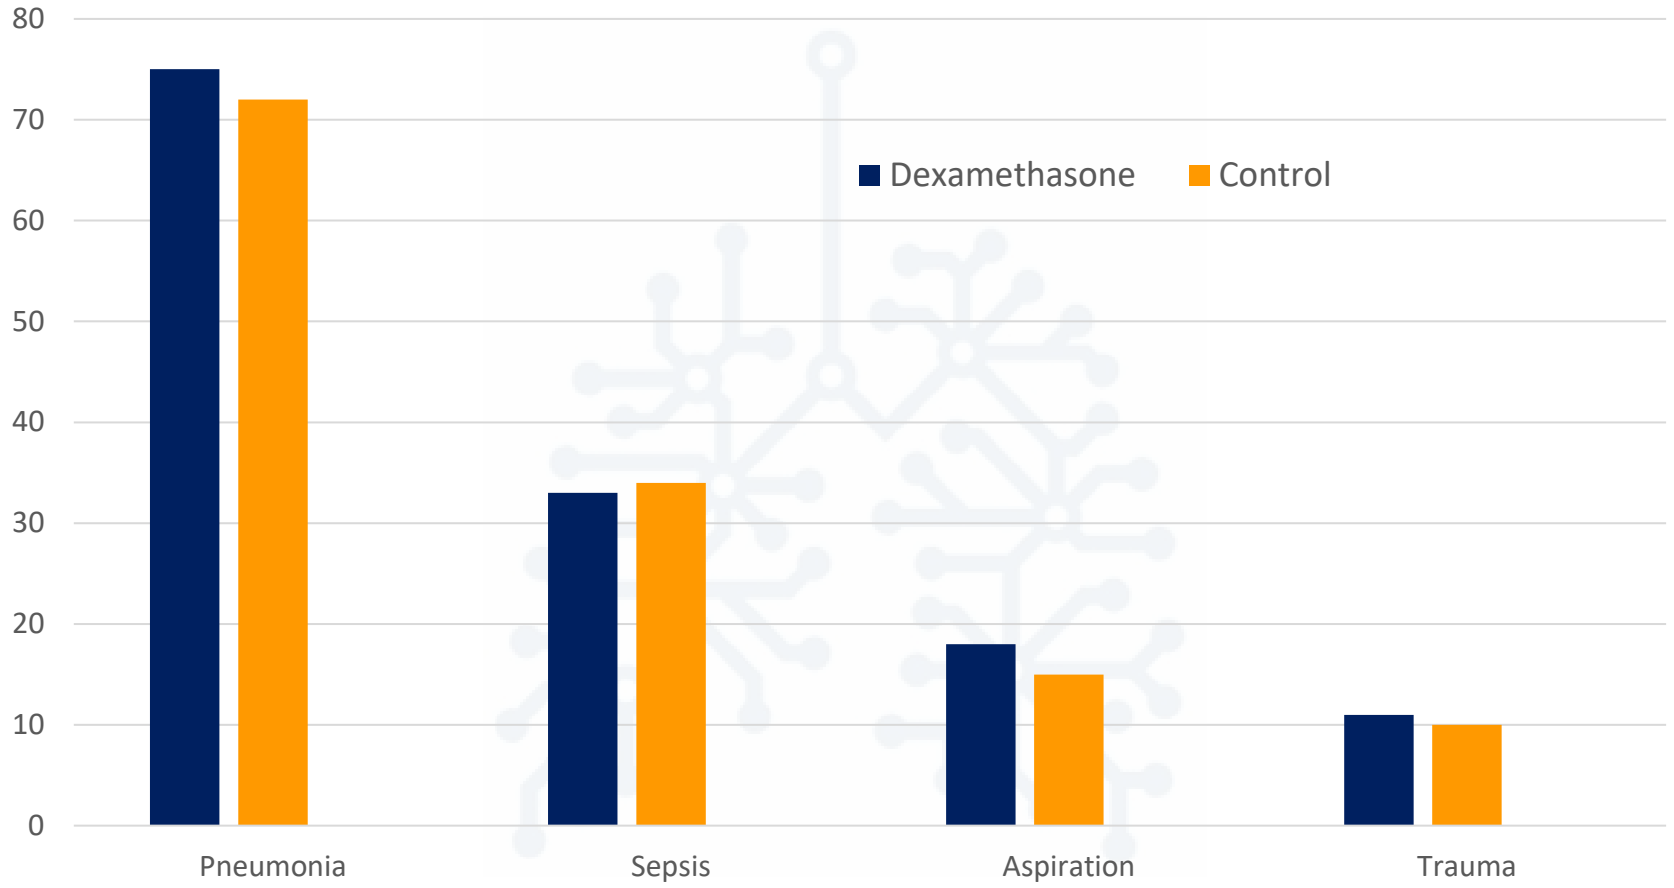
Main causes of ARDS



Debate: Subgroup analyses in clinical trials – fun to look at, but don't believe them!

Peter Sleight

John Radcliffe Hospital, Oxford, UK

Curr Control Trials Cardiovasc Med 2000, 1:25-7

- Analysis of subgroups results in a clinical trial is unreliable, even in a large trial.
- This is the result of a combination of:
  - Reduced statistical power
  - Increased variance
  - Play of chance
- The lack of a statistically significant effect is not evidence of lack of a real effect.

Corticosteroids in COVID-19 and non-COVID-19 ARDS: a systematic review and meta-analysis

Chaudhuri1,2 , Kiyoka Sasaki1 , Aram Karkar1 , Sameer Sharif1 , Kimberly Lewis1,2, Manoj J. Mammen3 , Paul Alexander2 , Zhikang Ye2 , Luis Enrique Colunga Lozano2 , Marie Warrer Munch4 , Anders Perner4 , Bin Du5 , Lawrence Mbuagbaw2,6, Waleed Alhazzani1,2, Stephen M. Pastores7 , John Marshall8 , François Lamontagne9 , Djillali Annane10, Gianfranco Umberto Meduri11 and Bram Rochwerg1,2,1

Purpose

Corticosteroids are now recommended for patients with severe COVID-19 including those with COVID related ARDS. This has generated renewed interest regarding whether corticosteroids should be used in non-COVID ARDS as well.

The main outcome for this review was 28-day-mortality

Results

We included 18 RCTs enrolling 2826 patients. The use of corticosteroids probably reduced mortality in patients with ARDS of any etiology (2740 patients in 16 trials, RR 0.82, 95% CI 0.72–0.95, ARR 8.0%, 95% CI 2.2–12.5%, moderate certainty). Patients who received a longer course of corticosteroids (over 7 days) had higher rates of survival compared to a shorter course

Conclusion

The use of corticosteroids probably reduces mortality in patients with ARDS. This effect was consistent between patients with COVID-19 and non-COVID-19 ARDS, corticosteroid types, and dosage

No clinical benefit of high dose corticosteroid administration in patients with COVID-19: A preliminary report of a randomized clinical trial

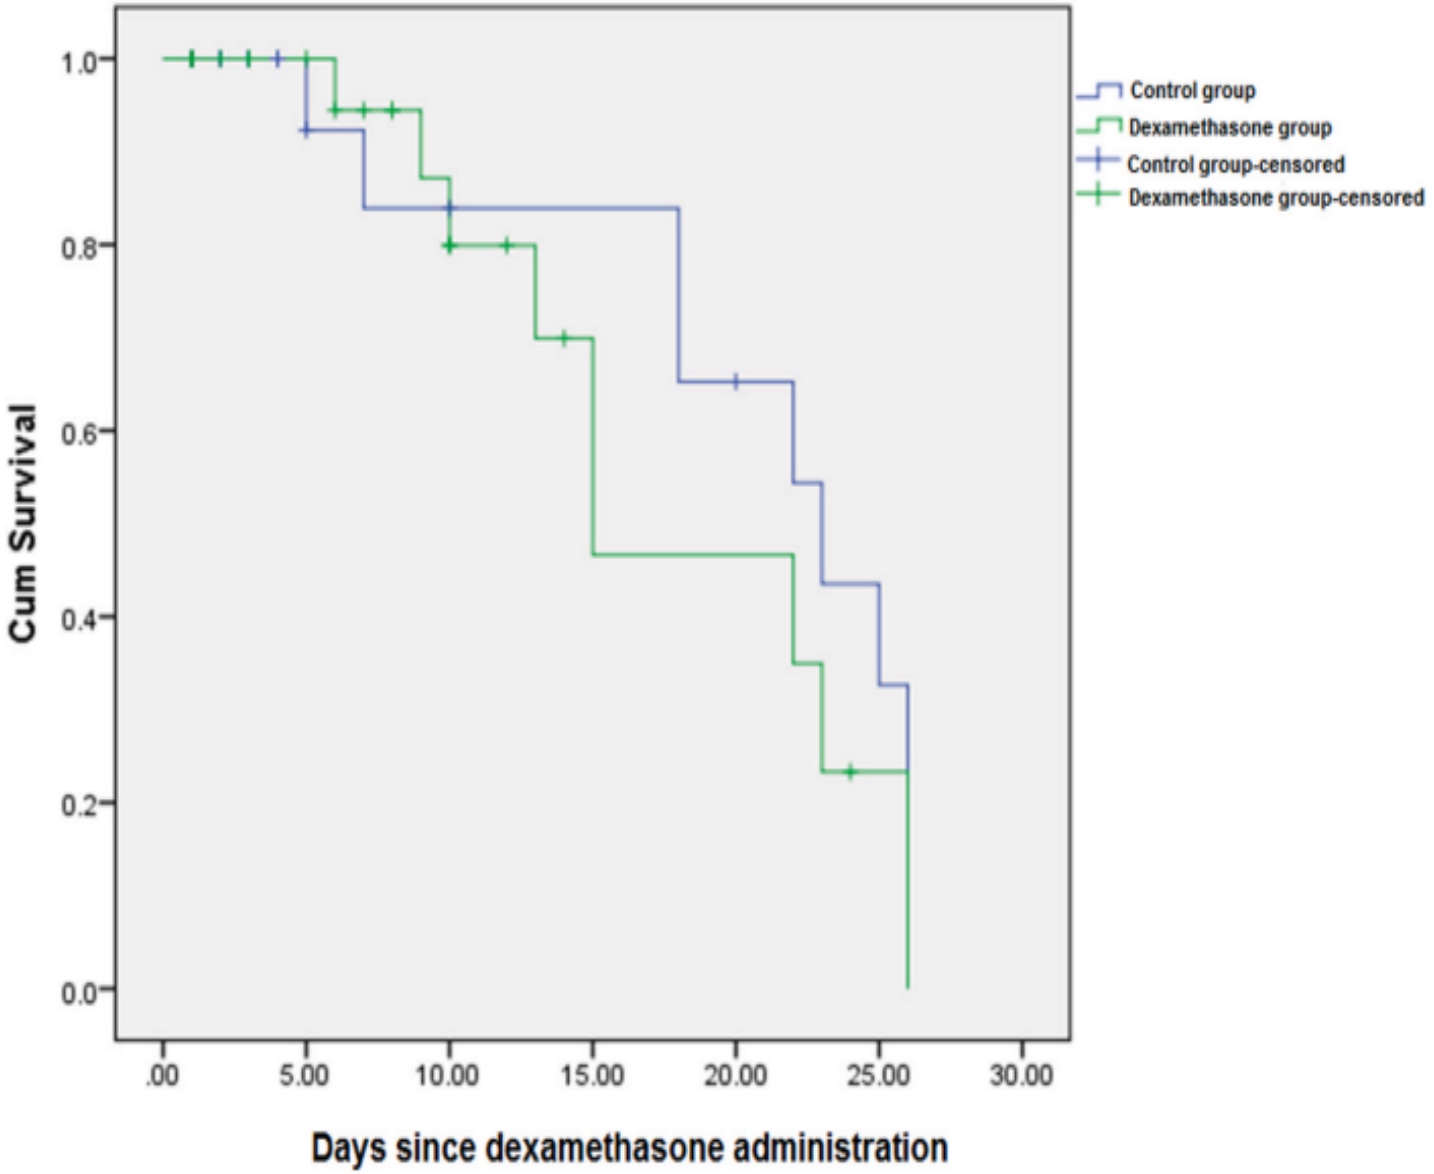
Hamidreza Jamaati [a], Seyed MohammadReza Hashemian [a], Behrooz Farzanegan [b], Majid Malekmohammad [b], Payam Tabarsi [c], Majid Marjani [c], Afshin Moniri [d], Zahra Abtahian [a], Sara Haseli [a], Esmaeil Mortaz [c,e], Alireza Dastan [f], Abdolreza Mohamadnia [a], Abdolbaset Vahedi [a], Fatemeh Monjazebi [g], Fatemeh Yassari [a], Lida Fadaeizadeh [h], Ali Saffaei [i], Farzaneh Dastan [a,j,*]

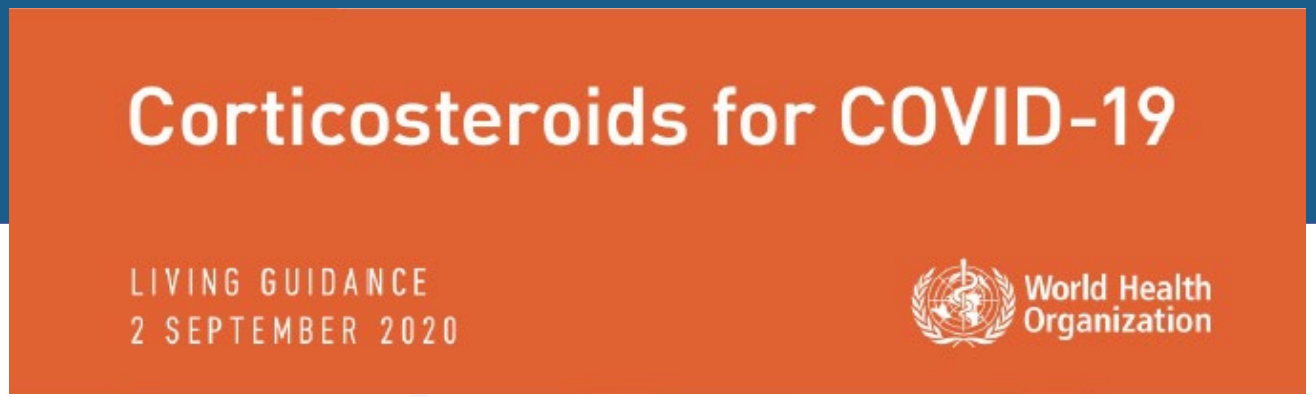
The aim of this study was to evaluate the clinical effects of dexamethasone administration in patients with mild to moderate acute respiratory distress syndrome (ARDS) due to coronavirus disease 2019 (COVID-19).

RESULT

No significant differences were observed in the other outcomes. This study showed that corticosteroid administration had no clinical benefit in patients with COVID-19-induced mild to moderate ARDS.

European Journal of Pharmacology 897 (2021) 173947





Understanding the recommendations

Recommendation 1:
We recommend systemic corticosteroids rather than no corticosteroids for the treatment of patients with severe and critical COVID-19 (strong recommendation, based on moderate certainty evidence).

Recommendation 2:
We suggest not to use corticosteroids in the treatment of patients with non-severe COVID-19 (conditional recommendation, based on low certainty evidence).

WHO website. Corticosteroids for COVID-19. 2020.

Ten reasons why corticosteroid therapy reduces mortality in severe COVID-19

José M. Añón[1,2*] and Jesús Villar[2,3]

*Intensive Care Med 2021**

Why a dose of 6 mg was selected in the RECOVERY trial?

Reporting overall all-cause mortality

DEXA-ARDS: ICU, hospital, and 60-day
RECOVERY: 28-day
WHO REACT meta-analysis: 5 at 28-day, 1 at 21-day, 1 at 30-day

Management: MV vs. Non-invasive MV vs. Oxygen

No definitive conclusions: type of corticosteroids, timing of initiation, optimum dose, duration of treatment, etc.

IT IS TIME to know the LONG-TERM outcome data of RECOVERY trial.

**Commentary to a paper by Arabi et al (Intensive Care Med 2020, 46:2067)*

Corticosteroids in ARDS: More questions than answers

Which one?	When?	Dose?	How long?
Methylprednisolone Hydrocortisone Dexamethasone	At ARDS onset Within 24 hours	Low dose Medium dose Higher dose	10 vs 14 vs 28 days With/without tapering
DEXAMETHASONE merits priority	At ARDS onset *(if intubated)* merits further attention	Near corticosteroid receptor saturation merits attention	10 days merits priority

New RCTs addressing dosage, duration, type of corticosteroids, and dose tapering

NCT04509973: COVID STEROID 2 (Higher vs. Lower Doses of Dexamethasone in Patients with COVID-19 and Severe Hypoxia)

NCT04545242: DEXA-REFINE (Efficacy of Higher vs. Lower Doses of Dexamethasone in Patients with Acute Hypoxemic Respiratory Failure Caused by Infections).

NCT04636671: MEDEAS (Methylprednisolone vs. Dexamethasone in COVID-19 Pneumonia).

Concluding Remarks

Key

- We have STRONG evidence that corticosteroids can reduce the risk of death in patients with ARDS.
- We have STRONG evidence that corticosteroids can reduce the risk of death in patients with non-ARDS AHRF.

Takeaways

We DO NOT have strong evidence for when to initiate and for how long to use corticosteroids in ARDS.

Whether DEXAMETHASONE is the corticosteroid of choice in ARDS merits further studies.
